Multiwall Bag UV/EB High and Low Slide Coatings

Via its acquisition of Actinic, Inc. in 2005, Northwest Coatings now carries a full line of UV/EB and WB Multiwall bag products. Northwest Coatings is recognized as a leading developer and producer of multiwall bag coatings and uniquely provides specific coefficient of friction properties and coating weight management tools for all application needs.

Due to largely to the consistent COF, gloss and rub resistance properties, the MW 720 and 742 series coatings are approved by all major end users of multiwall bags. These performance attributes are attained via a proprietary formula technique which utilizes solid particle technology. Since there are no migratory components in the formula, a consistent COF is maintained as materials are processed and shipped. This technology has helped set the industry standard and continues to be improved upon even after being in commercial use for over 7 years.

Using Northwest Coatings' proprietary technology has resulted in bag manufactures lowering their applied cost through lower coating weights, reduced press downtime, improved press speeds and other process efficiencies. Northwest Coatings can supply proprietary analytical software to measure both cure and coating weight so that savings are verified off press. This system can also become a valuable tool for providing consistent quality by allowing cure and the associated curing equipment to be analytically measured and monitored over time.

These products are available for flexo, gravure and offset press arrangements.
